# Bias Manual

SV Modular

Bias Users Manual

Figure 1: Bias

Personal Modules Bias is a simple, 16-voice polyphonic automatic Biasing utility module.

It accepts an input and attempts to automatically adjust for any DC biasing.

In

The input supports up to 16 polyphonic channels.

Out

The output jack provides output generated from the Bias module. This polyphonic output is based on the number of inputs connected to Signal, meaning that if a polyphonic cable with 16 channels is connected to In, then the output will present 16 channels.
