Shp Users Manual

Figure 1: Shp

Shp is a unique envelope generator that creates an amplitude envelope from an incoming audio source. The output from this module can be used with a *Voltage Controlled Amplifier* or *VCA* to shape the VCA input into a sound that matches the original input's amplitude curve.

Shp has a built-in attenuator to adjust the voltage range of the resulting envelope.

IN is the input source that the envelope is to be generated from.

MIN controls the minimum voltage of the generated envelope. It can range from -5 volts to 10 volts.

MAX controls the maximum voltage of the generated envelope. It can range from -5 volts to 10 volts.
